2ajar · إيجار

Find a place to rent in Lebanon by just saying what you need, in Arabic, English or Arabizi.

https://2ajar.halyoon.com

The idea in one minute

Renting in Lebanon is not just "2 bedrooms in Hamra". People ask: **Is there 24/7 electricity? How much is the generator bill? Is the water from the state or from trucks? Is the area safe and quiet? Is there parking? Does it get cold in winter?** Most listing sites can't answer that, and their filters don't speak the way people talk.

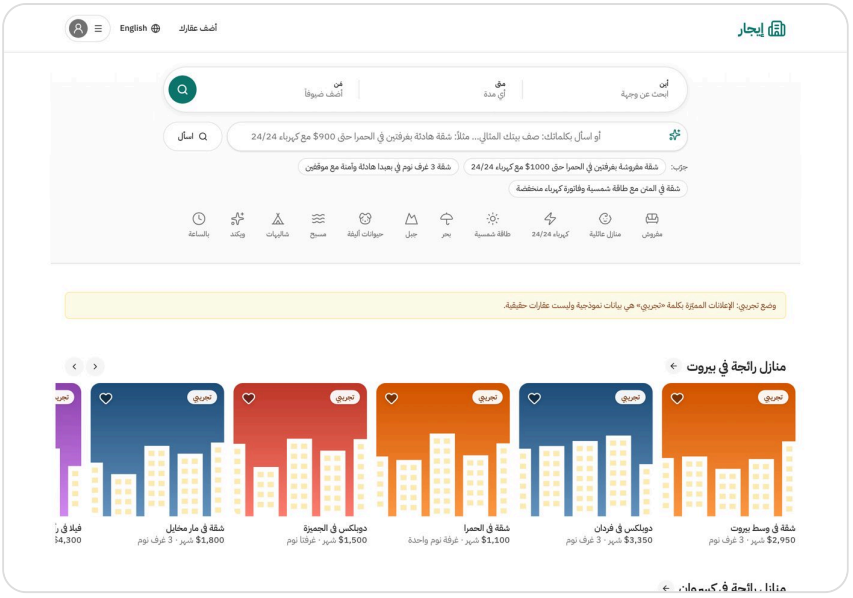

2ajar is a rentals-only marketplace (mainly apartments by the month, also chalets by the night and places by the hour) where you type what you want in your own words, and it shows matching homes **and explains why each one fits**.

For people looking

- Ask in plain words (Arabic, English, Arabizi)
- See ✓ / × / "not reported" for every wish
- Real living costs: electricity, water, sewage, parking
- Neighbourhood facts: safety, thefts, noise, garbage, flooding
- Save homes with a heart, contact the owner on WhatsApp

For owners and brokers

- Free listing with photos (location data removed automatically)
- Add the details renters really ask about
- Leads only with the renter's explicit consent
- Brokers can bulk-import listings from a spreadsheet (CSV)
- Arabic or English, on phone or computer

Home page (Arabic is the main language): "Where · When · Who" search, "or just ask in your own words", and categories.

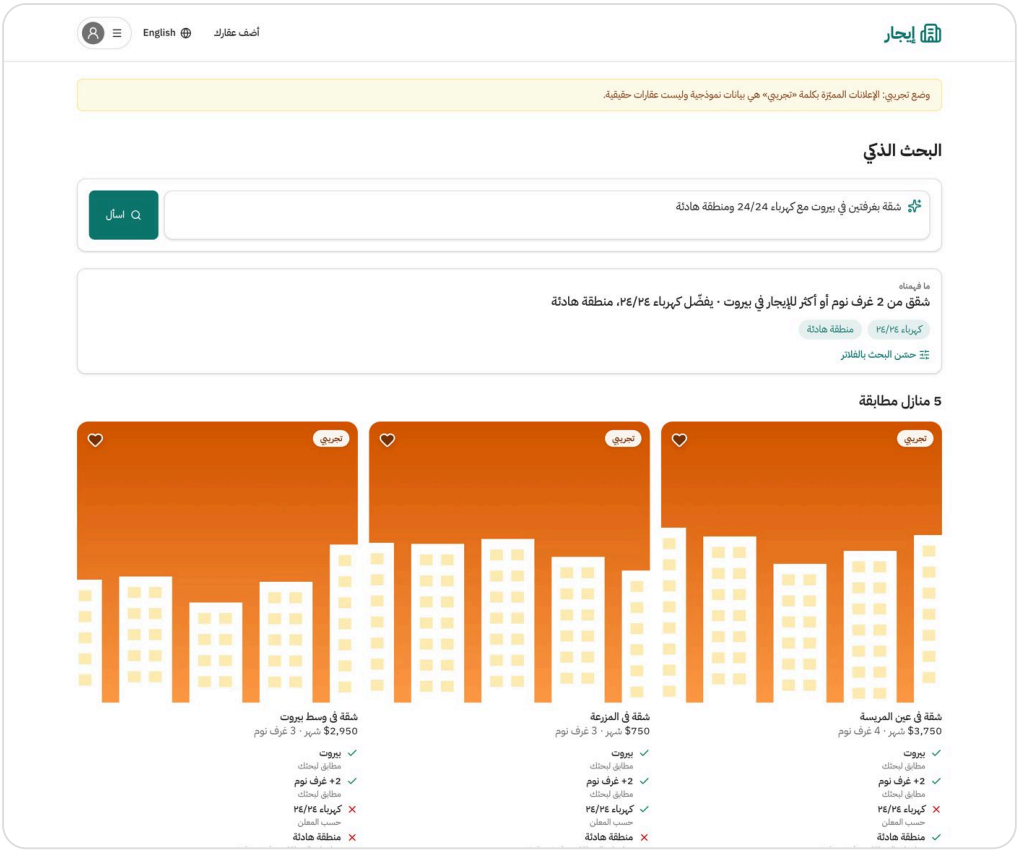

The smart search: "just ask"

You type a sentence. 2ajar understands the area, budget, number of rooms, how long you want to rent, how many guests, and the "nice to haves", then ranks homes and tells you exactly what matches.

«شقة بغرفتين في بيروت مع كهرباء 24/24 ومنطقة هادئة»
"2-bedroom apartment in Beirut with 24/7 electricity in a quiet area"

"bade chi 2 ghoraf bl achrafieh ma3 moteur ta7et 800" (Arabizi works too)

"Chalet in Faraya for the weekend for 6 guests, under $250 a night"

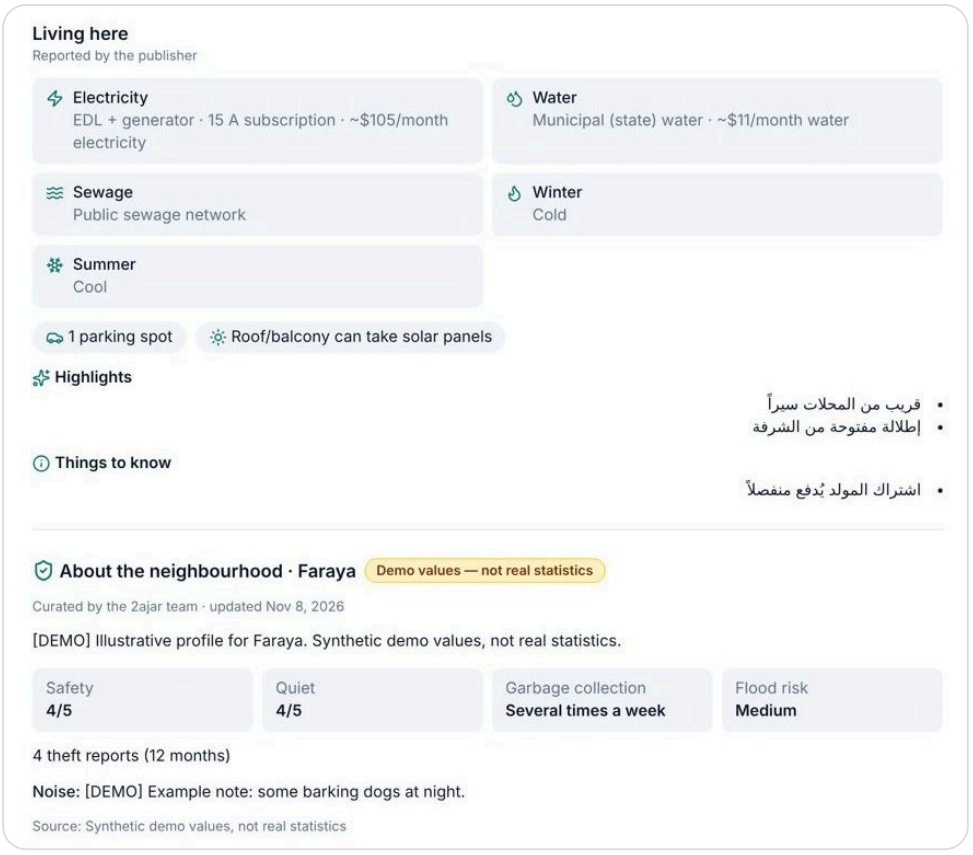

The answer: what we understood, then each home with ✓ match, × no, or "not reported", and where the fact comes from (the publisher, or the 2ajar team for area facts).

> **Honest by design.** The search never guesses. If a publisher didn't say whether there's a generator, it shows "not reported" instead of inventing a "yes". If nothing matches exactly, it says what it loosened (for example "budget raised to $1,080"). It runs on rules we wrote, so it costs nothing per search and needs no paid AI service.

What a listing shows

Besides photos, price and rooms, every home can show what living there is really like, and every area has facts curated by the 2ajar team.

"Living here" (reported by the publisher) and "About the neighbourhood" (curated by 2ajar, with date and source). Demo values are clearly labelled.

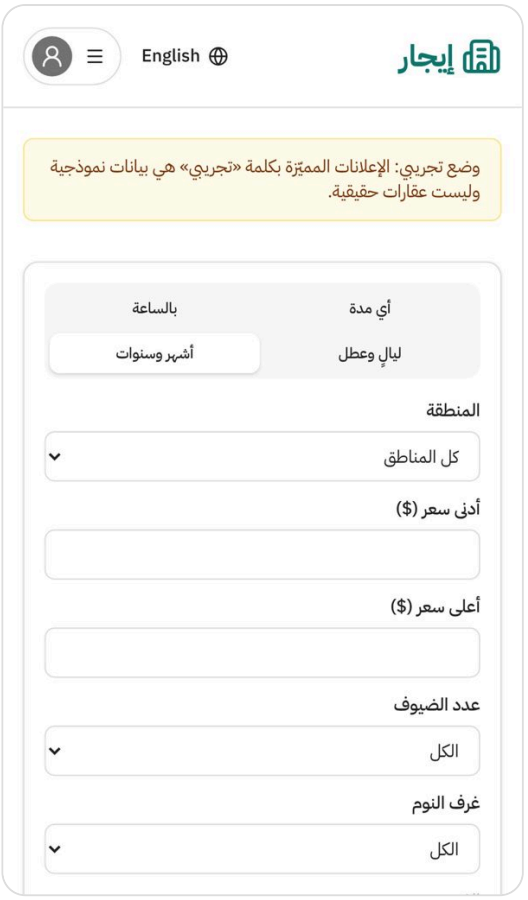

From the publisher	From the 2ajar team, per area
Electricity source (state / generator / solar), amps, monthly bill · Water source and cost · Public sewage or septic tank · Parking spots · Can it take solar panels · Does the elevator work in power cuts · Warm or cold in winter, cool or hot in summer · Highlights and things to know	Safety score · Theft reports in the last 12 months · Quietness and noise notes (e.g. barking dogs) · Garbage collection · Flood risk · Short summary, with date and source

Feels like Airbnb, made for Lebanon

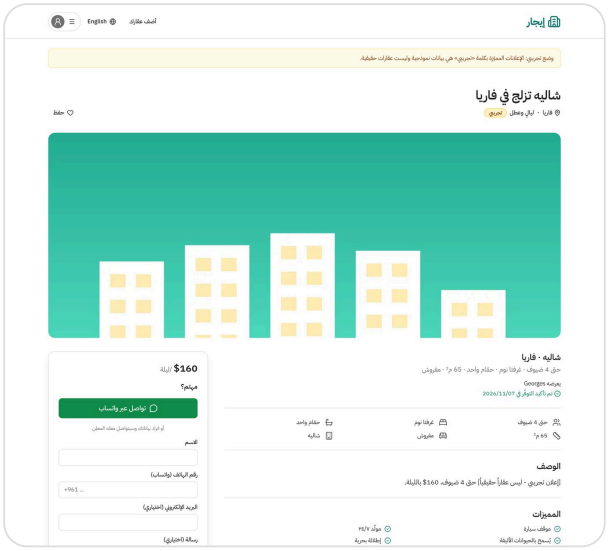

The design follows what people already know from Airbnb: rows of homes per place ("Popular homes in Beirut"), square photos with a heart, a search bar with **Where · When · Who**, and an app-like bar on phones. "When" means how long: **by the hour, nights & weekends, or months & years**.

Phone, Arabic.

Monthly rentals list.

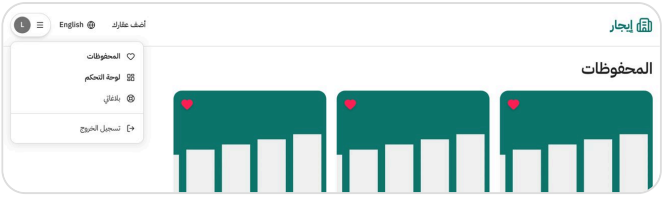

A chalet page: photos, price per night, "Save", contact card, and "similar homes nearby".

Accounts: renters, owners and brokers

Anyone can browse without an account. Signing up (free) lets you save homes and report problems; owners and brokers get a dashboard. Everything sits in the ☰ + **avatar menu** at the top, like on Airbnb.

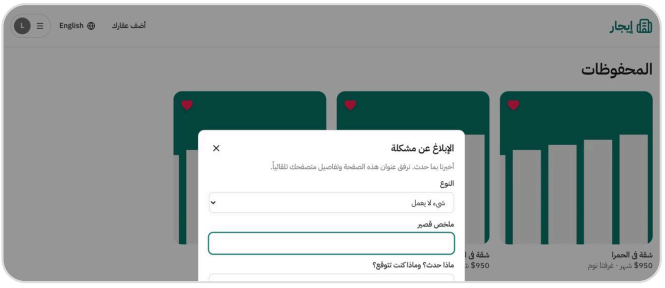

Log in (email + password). Sign-up offers: renter, owner, or broker (with an agency name).

A renter's menu: Saved homes, Dashboard, My tickets, Log out.

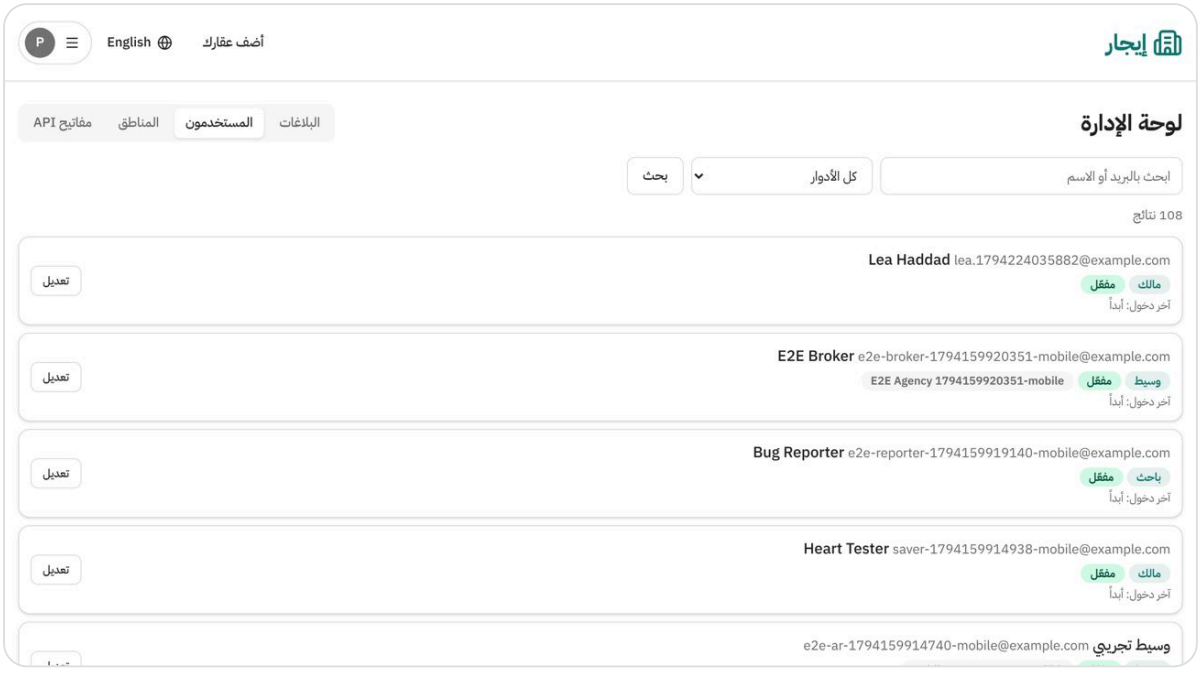

Owner / broker dashboard: their listings with status and actions (publish, pause, confirm still available, edit), CSV import, and the people who asked to be contacted.

The floating "report a problem" button: signed-in users send a bug or a question with an optional screenshot.

The admin panel

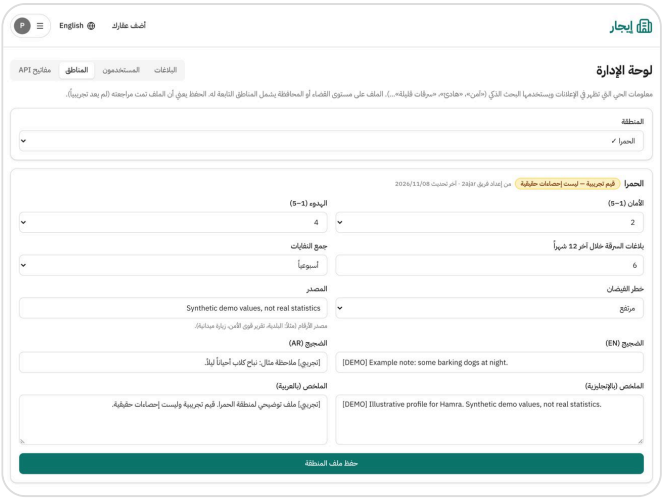

The team's back office, at **Admin** in the menu. What each person can do depends on their role (staff or platform admin), and admins can grant individual permissions.

Users: search everyone by name or e-mail, filter by role, change a role, deactivate an account, grant extra permissions. Admins can't lock themselves or the last admin out.

Tickets: bug reports and questions from users, with status, priority, assignee, private screenshots and internal notes.

Areas: the team enters each neighbourhood's safety, thefts, quiet, noise, garbage and flood facts, with a source. Search and listing pages use them.

> The first admin account comes from the server settings (an e-mail and password stored privately in Railway), so the owner can always get back in. Team members can also connect an AI assistant (like Claude) to the admin data with a personal, expiring access token. Screenshots on this page come from a local test copy with test accounts.

How it works for a renter

1. **Search** with the Where · When · Who bar, a category (Furnished, Family homes, 24/7 power, Sea view, Chalets…), or just type a sentence.
2. **Compare** homes with clear reasons: what matches, what doesn't, what wasn't reported.
3. **Save** favourites with the heart, see "homes near me" (location is used once and never stored).
4. **Contact** the owner on WhatsApp, or leave your number. It's shared only if you tick the consent box.

Trust and privacy

- Owners' phone numbers are not shown on the page. They're revealed only when someone taps WhatsApp, which also helps stop scrapers.
- Photos are cleaned of hidden GPS/camera data on upload.
- Listings expire unless the owner confirms they're still available, so the site stays fresh.
- Demo content is always labelled "DEMO / تجريبي" and disappears when the site goes live with real listings.
- A floating "report a bug" button and an admin back office let the team fix problems quickly.

Where it stands today

Done and live	Live at 2ajar.halyoon.com. Search (smart + filters), Airbnb-style home and listing pages, Arabic/English, favourites, owner dashboard, photo upload, CSV import for brokers, leads with consent, area facts admin, bug reports, team admin, Telegram alerts (ready to switch on).
Next	Add real listings and photos · Switch off demo mode · Enter real area facts for each neighbourhood.
Later	Reviews (once people have stayed) · Availability calendar for chalets · Paid features for brokers (to be decided).

> Built with Next.js (website), Python FastAPI (server) and PostgreSQL (database), hosted on Railway. About 250 automated API tests, 86 website tests and 30 browser tests run on every change.
